

NitrousOxide

Dosage can be adjusted

Nitrous oxide is relaxing

Nitrous oxide mask

Nitrous oxide is calming

The reason for using nitrous oxide, or laughing gas, is for its calming effect. Because nitrous oxide does not numb the teeth, anesthetic is still necessary.

How nitrous oxide is administered

Nitrous oxide has the pleasant effect of making a person more relaxed. It is breathed in through a small mask that covers the nose. It takes only a few minutes to notice the effect. People most often describe the feeling as being relaxed, unconcerned, happy, slightly numb, and disconnected from what is happening around them.

We can adjust the dosage of the nitrous oxide gas to fit your needs. You can also control its effects by your breathing. The more you breathe deeply through your nose, the more you feel its effect. There is no long lasting effect.

Usage exceptions

We do not use nitrous oxide if you have an inner ear infection or asthma symptoms.

Let us know if you would like to try nitrous oxide to feel more relaxed during your dental appointment.
