

Considering Dentures

for a Full Arch

Full denture

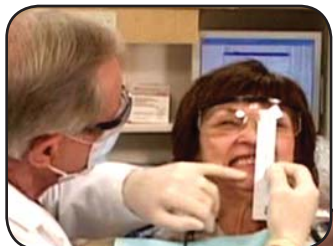

When all of your upper or lower teeth are missing, we may recommend a full denture for replacing them.

Dentures can be a good way to help you eat more easily, speak clearly, and have a natural-looking smile.

X-rays showing health of jawbone

Making an impression

Taking measurements

Color matching

Full denture

Diagnosis and treatment

To determine if dentures are right for you, we perform a thorough exam of your gums and any remaining teeth. The exam typically includes x-rays to check the health of your jawbone. We also take impressions to create an accurate model of your mouth.

The best positions of the center line and lip line are recorded, so the denture teeth can be placed attractively. We will work with you to select the best color and shape for your new teeth.

There are several types of full dentures, so we will talk with you about the best type for your situation.

Benefits of dentures

Dentures replace missing teeth, and this provides many benefits, including easier eating and clearer speech. Dentures help your jaws work in their correct and most comfortable position; so dentures can promote the proper functioning of the jaw joints and muscles. In addition, dentures provide support for lips and cheeks, giving you a more youthful appearance.
